

Your voice heard Sprint 1

Task:

Determine criteria for grouping

- Criteria for grouping
 - What is Your Voice Heard?
 - First of all, we must first describe that the project to be completed by our group is an application or a web page. On this application or web page, we hope that we can send some premade emails about various politics or even more important things that happen. This includes issues such as elections, protests, and environmental issues. Users can put these important events that they want to express or are currently happening on this platform through our platform and send emails to federal representatives and senators related to these issues.
 - Why should we group them?
 - When it comes to these federal representatives and senators, we need to classify them according to our predetermined ideas in advance. Because it allows users to easily contact or find the information they want. For example, I am a user, and I hope to report my question about an issue or share my thoughts with relevant people. I definitely hope that I can find the person I want very quickly and easily. This will not only benefit the users but also allow us to better manage. What we want to do is that users can have a very good experience, and related questions can be uploaded quickly.
 - How should we group them?
 - How to group is actually very simple, because we only need to find the common points that users will report and the common points of these federal representatives and senators to the group.
 - First of all, the condition of our grouping must be a regional priority. This can help users to lock to the area related to this problem and exclude other options that have no relationship. This classification is the most simple and clear.
 - Secondly, it must be grouped according to the question itself, which is a very important point. Because when a user has an idea or question and wants to communicate with a federal representative and a senator, the question or idea must take precedence. This must be a very important thing for users, so when they open the classification list, the first thing they see is that the classification list about the problem itself will be very

simple to find what they want. Examples include environmental issues, education issues, budgets, civil liberties, government and worker rights, and so on.

- Then we need to classify these problems in detail, such as education problems, we can continue to classify it. The significance of this is to help users to find people who are related to the problem, and secondly, to allow those who receive the problem feedback to know the general problem before viewing the content of the letter in detail.
- Next, we first need to obtain a list of the two departments. Then group the federal representatives and senators that the user wants to contact. We first need to separate the two. The user can directly choose which of the two targets he wants to contact.
- Finally, it is not a big category, but some small filtering options to help users lock in faster. For example, based on the field they are good at, the year of the campaign, and the beginning of their surname.
